Description of Defect, how it came to light, and possible consequences if ignored.	The defect is due to an inappropriate programming of the Engine Control Unit (ECU). When the intake air temperature is high, the ignition timing, fuel injection and/or boost pressure may not be controlled properly which may result in abnormal combustion. If abnormal combustion occurs, it may cause a connecting rod to break due to the abnormal high pressure in a cylinder. In the worst case scenario, a cylinder block may be damaged, leading to engine oil leakage that may results in a fire.
