<b>Subject</b>	Reprogram airbag control unit.
<b>Progress</b>	<b>On Going</b>
<b>Affected Vehicle Identification Number (VIN)</b>	Listed as below
<b>Description of Defect, how it came to light, and possible consequences if ignored.</b>	On the affected vehicles a condenser may fail because of inadequate heat treatment in the airbag control unit. A condenser failure can lead to a sensor signal change. In most cases this sensor signal change is detected by the control unit and the airbag system is switches off. A switched-off airbag system is indicated by the airbag warning lamp in the instrument cluster, so that the driver of the vehicle is clearly informed of a fault in the airbag system. But it cannot be completely ruled out that the control unit may interpret the sensor signal change as a crash-like signal (incorrect front crash detection), which can result in the airbag(s) and/or belt tensioner(s) being triggered incorrectly.
<b>Remedial Action</b>	On the affected vehicles the software of the airbag control unit must be updated.
